AIMIFY

Feature Checklist

Every item in the Full Proposed Feature Set (August 2026), ticked against what is built. Status as of 21 October 2026, checked against the aimify-web and aimify_desktop repositories.

Where things stand. 58 of 78 proposed items are done and 4 are partly done. For the MVP, 54 of 57 items are done and 2 partly done. The account, subscription, payments, admin, inventory, customer, supplier and credit foundations are in place. Sales and purchases are on the server: a sale takes stock out of its warehouse and a received purchase adds it, both posting to the customer's or supplier's account. Expenses are on the server too, with categories, budgets, recurring expenses and receipts. The dashboard shows sales, gross and net profit, spending and debts for a chosen period with charts, and the sales, purchase, profit and loss and stock reports cover any period with filters, PDF and Excel. Offline sync and two-factor sign-in were delivered ahead of plan.

Done built and tested Partial incomplete, or saved on one computer only Not started nothing built yet

Summary by phase

Phase	Done	Partial	Not started	Total	Progress
MVP	54	2	1	57	
Phase 2	2	2	6	10	
Phase 3	0	0	4	4	
Differentiators	2	0	5	7	
All items	58	4	16	78	

Progress by module

Module	Phase	Done	Partial	Not started	Progress
Authentication & Account Management	MVP	4	0	1	
Organization Management	MVP	4	0	0	
User & Permission System (RBAC)	MVP	3	0	0	
Product Management	MVP	3	0	0	
Inventory Management	MVP	5	0	0	
Warehouse Management	MVP	4	0	0	
Stock Transfer	PHASE 2	0	0	2	
Purchase Management	MVP	3	0	0	
Sales Management	MVP	2	0	0	
Customer Management	MVP	1	1	0	

Module	Phase	Done	Partial	Not started	Progress
Credit Sales & Debt Management	MVP	3	0	0	
Supplier Management	MVP	1	1	0	
Expense Management	MVP	2	0	0	
Returns Management	PHASE 2	0	0	3	
Dashboard & Analytics	MVP	2	0	0	
Reports	MVP	5	0	0	
Notifications	PHASE 2	1	2	0	
Subscription Management & Enforcement	MVP	3	0	0	
Payment System	MVP	3	0	0	
Super Admin Dashboard	MVP	4	0	0	
Audit Logs	MVP	2	0	0	
Offline Capability	PHASE 2	1	0	0	
Mobile Application	PHASE 2	0	0	1	
Advanced Platform Features	PHASE 3	0	0	4	

Part 1 — Core platform modules

Authentication & Account Management MVP

Done	**Sign up, login, logout, password reset**	Web and desktop. Login is rate-limited; reset link is single-use and lasts 1 hour.
Done	**Email verification**	Link valid 24 hours, can be resent; admins can verify by hand.
Not started	**Phone verification where required**	Deferred on 21 Oct 2026. When built: owners only, at onboarding; SMS provider still to choose.
Done	**Session management and profile management**	Signed-in devices list, sign out one or all; name and phone editable and audited.
Done	**Two-factor authentication**	Authenticator app with QR setup and 10 backup codes, on web and desktop. Delivered early (planned as a later pass).

Organization Management MVP

Done	**Company profile: name, registration number, address, phone, email, logo** Logo stored on Vercel Blob.
Done	**Industry, currency, tax configuration, date format, time zone** All editable on the Organization page.
Done	**Every transaction tied to its organization ID (tenant isolation)** Enforced in every query (application level).
Done	**Guided setup wizard** Website: profile, organization, first warehouse, trial, download. Desktop: a guided flow through company & warehouse, products, opening stock, team invitations and subscription, opening automatically for Owners and Administrators until finished.

User & Permission System (RBAC) MVP

Done	**Six roles: Owner, Administrator, Warehouse Manager, Sales Staff, Inventory Staff, Accountant/Finance** Enforced on the website, in the API and in which desktop screens are visible.
Done	**Granular per-module permissions (view / create / edit / delete)** View, add, edit and archive/delete per module (products, categories & units, stock in/out/adjust, warehouses, customers, suppliers, credit), checked on every API call and deciding which desktop screens and buttons show.
Done	**Owner can assign roles and permissions to staff** Owners and Administrators invite people and change roles; the Owner edits each role's permissions on the website (Team, then Roles & permissions), with reset to defaults and an audit trail. Set per role, not per person.

Product Management MVP

Done	**Full product record (SKU, barcode, name, description, category, brand, unit, prices, min/max stock, current stock, image, supplier, status)** Every field, including the usual supplier (picked in the form or matched by name in the Excel import).
Done	**Configurable units of measurement** Defaults seeded; custom units per organization.
Done	**Product categories** Configurable per organization. Desktop also has bulk import from Excel.

Inventory Management MVP

Done	**Real-time current stock per product**
Done	**Stock in, stock out, stock adjustment, stock count** Atomic updates; roles limit which types each person can record.
Done	**Full stock movement history (never a silent overwrite)** Ledger records before/after stock, user and reason.
Done	**Low-stock and out-of-stock alerts** Returned by the API, listed in the desktop app and emailed.
Done	**Inventory valuation** Valuation report in the desktop app (Reports, Valuation): value at cost and selling price, potential margin, by product, category or warehouse, filterable, with unreliable rows flagged. Priced at current purchase price until purchases are recorded.

Warehouse Management MVP

Done	**Warehouse profile: name, address, manager, phone, status**
Done	**Create, edit, disable warehouses**
Done	**Per-warehouse stock view and valuation** Each product has a balance per warehouse (total kept alongside). Inventory filters by warehouse; each warehouse shows its units and value. Stock out can't take a warehouse below zero, and a warehouse can only be disabled when empty.
Done	**Single warehouse in MVP** Enforced by plan limits (one active warehouse on the default plan).

Stock Transfer PHASE 2

Not started	**Transfer products between warehouses (source, destination, quantity, date, user, reason)** Per-warehouse stock is in place, so this can be built.
Not started	**Reference number and transfer status per transfer**

Purchase Management MVP

Done	**Purchase record (supplier, warehouse, products, quantity, unit cost, discount, tax, total, payment status, paid, balance, date, user)** On the server with numbered references (PO-0001). Payments post to the supplier's account; a new purchase can also be recorded offline. Purchase orders, goods received notes, payment receipts and supplier statements print or save as PDF.
Done	**Purchase statuses: draft, pending, received, partially received, cancelled** Received line by line; cancelling a paid order records what the supplier owes back.
Done	**Receiving a purchase automatically increases inventory** Into the purchase's warehouse, in one step with the purchase price update and the supplier's balance.

Sales Management MVP

Done	**Sales record (invoice number, customer, warehouse, products, prices, discount, tax, total, paid, balance, payment method, salesperson)** On the server with numbered invoices (INV-0001), walk-in or customer, can be recorded offline. Other prices and discounts need a permission; Owner/Admin can void. Invoices and receipts print or save as PDF.
Done	**Completing a sale automatically decreases inventory** From the chosen warehouse, in one step with the customer's balance; never more than the warehouse holds, even when two people sell the last units at once. Voiding puts the stock back.

Customer Management MVP

Done	**Customer record: name, phone, email, address, customer type, credit limit, current balance, status** Owner-managed customer types with default credit limits; archive and restore; search, filters and summary cards; a page per customer with totals bought, sales and account; Excel import (with opening balances) and export.
Partial	**Full transaction history: purchases, payments, balances, credit sales, returns** Sales, payments, adjustments and balance on each customer, with a printable statement. Returns come with Returns Management (Phase 2).

Credit Sales & Debt Management MVP

Done	**Record credit sales and repayments** Shared ledger; safe against double-posting and simultaneous payments. A payment on account settles the oldest invoices first and marks them paid.
Done	**Track outstanding balances and set customer credit limits** A credit sale over the limit is blocked; an Owner or Administrator can allow it, and that is recorded.
Done	**Customer debt history, debt reports, receipts** Payment terms and due dates; an aging report (not yet due, 1-30, 31-60, 61-90, 90+ days) for customers and suppliers with PDF and Excel; a 'who to chase' list; numbered receipts (RCPT-0001) showing which invoices each payment settled; statements.

Supplier Management MVP

Done	**Supplier record: name, phone, email, address, contact person, products supplied, outstanding balance** All fields plus payment terms; a page per supplier with what you owe and what is overdue, what you bought, products supplied with price history, and reorder suggestions that fill a purchase order. Search, filters, archive and restore, Excel import (with opening balances) and export.
Partial	**Supplier history: purchases, payments, returns, balances** Purchases, payments, balance, price history and statements on each supplier's page. Returns come with Returns Management (Phase 2).

Expense Management MVP

Done	**Record expenses by category**	On the server (EXP-0001), offline too. Owner-managed categories with monthly budgets; recurring expenses (rent, salaries) recorded in one click when due; a report by category, month and warehouse with PDF and Excel. Old expenses saved on a computer can be uploaded.
Done	**Expense fields: category, description, amount, date, payment method, warehouse, user, receipt**	All of them, plus who was paid and their receipt number; a photo or PDF of the receipt is attached. Edits keep who and when; mistakes are voided with a reason.

Returns Management PHASE 2

Not started	**Sales returns (inventory increases)**	
Not started	**Purchase returns (inventory decreases)**	
Not started	**Every return references its original transaction**	

Dashboard & Analytics MVP

Done	**Key cards (products, inventory value, sales, purchases, customer and supplier debt, expenses, profit, low stock)**	All of them on the desktop, for today, this week, this month, last month or this year, each compared with the period before; gross profit (with margin) and net profit. The web dashboard shows this month so far. Each role only sees the modules it may see.
Done	**Charts (sales, purchases, expenses, top sellers, stock movement, debt, warehouse performance)**	Sales trend with gross profit, money in vs out (sales, purchases, expenses), top products and customers, what is owed and overdue both ways, and sales and stock value by warehouse, alongside the existing stock movement and stock health charts.

Reports MVP

Done	**Inventory reports: current stock, valuation, movement, low/out of stock, adjustments**	Valuation, stock health and the stock movement history: by product, type and person, each movement with who made it and the sale or purchase behind it; adjustments are a filter.
Done	**Sales reports (by period, product, customer, employee, warehouse)**	By day or month, product, customer, staff member and warehouse: units, sales, discounts, tax, cost, gross profit and margin, paid and outstanding, plus every sale.
Done	**Purchase reports (by supplier, product, warehouse)**	By supplier, product (average, lowest and highest cost), warehouse, status and period: ordered against received, paid and not yet paid, plus every purchase.
Done	**Financial reports: revenue, expenses, gross profit, debts, payments**	A profit and loss statement (net sales, cost of goods, gross profit, expenses by category, net profit) and money in and out by payment method; debts in the aging report.
Done	**Filtering by date, warehouse, user, customer, supplier, product**	Any period (presets or custom dates) with the filters each report needs. Every report prints to PDF and saves to Excel, ahead of the Phase 2 plan.

Notifications PHASE 2

Partial	**Low/out of stock, subscription expiring/expired, payment success/failure, customer payment, purchase received, transfer completed** Stock, trial, subscription and payment emails are built. Customer payment, purchase received and transfer emails aren't.
Done	**Email notifications (MVP)** Through Resend, with a daily job for reminders and renewals.
Partial	**SMS, WhatsApp and push notifications** WhatsApp is built: invoices, receipts, overdue reminders, purchase orders and stock alerts, automatic once Aimify's WhatsApp Business account is set up (docs/whatsapp-setup.md), and share buttons in the desktop app now. SMS and push aren't.

Subscription Management & Enforcement MVP

Done	**Plan, status, start/expiry, billing cycle, amount, payment history, renewal status**
Done	**Statuses: trial, active, past due, expired, suspended, cancelled** 14-day trial; locked organizations are refused by the API.
Done	**Enforced plan limits (users, warehouses, products) configurable from admin**

Payment System MVP

Done	**Subscribe, renew, upgrade, downgrade, cancel** All built. The Owner picks a plan on the billing page: an upgrade starts at once and charges the difference for the days left in the paid period; a downgrade starts when that period ends (no refunds) and can be undone until then. Being over a cheaper plan's limits deletes nothing; adding more is blocked until under.
Done	**Payment verification, history and receipts** Paystack in TEST mode: live keys and business verification are still needed.
Done	**Payment provider abstraction (swap or add Flutterwave later)** Billing, renewals and plan changes go through one provider interface; Paystack is the first provider. The Aimify team picks the provider for new payments in the admin panel; saved cards keep renewing with the provider that saved them. Adding Flutterwave is one new provider file plus its keys.

Super Admin Dashboard MVP

Done	**Platform dashboard: organizations, subscriptions, MRR, new registrations, churn** Overview plus an Insights page.
Done	**Organization management: view, search, suspend, reactivate, usage and activity**
Done	**Plan configuration: create, edit, disable, limits and pricing**
Done	**Payment history, support tickets and issue tracking** Payments page and a support inbox with email replies.

Audit Logs MVP

Done	**Every important operation logged with before/after values**
Done	**IP and device information**

Offline Capability PHASE 2

Done	**Local database with a sync queue** Delivered early in the desktop app: products, stock, customers, suppliers and credit are queued offline and synced later.

Mobile Application PHASE 2

Not started	**Android/iOS from the same Flutter codebase**

Advanced Platform Features PHASE 3

Not started	**Accounting and payroll integration**
Not started	**Point of sale (POS)**
Not started	**E-commerce integration and public API** The v1 API is for the desktop app only.
Not started	**Advanced BI, multi-currency/country, advanced tax**

Part 2 — Differentiator features

Done	**WhatsApp-native workflows** MVP / NEAR-TERM Send on WhatsApp for invoices, receipts, reminders and purchase orders in the desktop app; automatic messages (with each customer's consent, chosen per business) start when Aimify's WhatsApp Business account is connected.
Not started	**Customer credit risk scoring** MVP / NEAR-TERM The customer and credit data it needs now exists.
Not started	**Photo-evidence stock adjustments** MVP / NEAR-TERM Image storage is in place; stock movements don't take a photo yet.
Done	**Offline-first with sync** PHASE 2 Built in the desktop app.
Not started	**Landed-cost calculator for imports** PHASE 2
Not started	**Inter-business network (surplus marketplace, pooled purchasing)** PHASE 2
Not started	**Embedded inventory financing** PHASE 3

Suggested next steps

1. **Connect WhatsApp Business.** Meta business verification, a number and five message templates (docs/whatsapp-setup.md); automatic messages then start.
2. **Set up the plan lineup.** Create and price the plans on the admin Plans page; customers can then change plan themselves.
3. **Go live with Paystack.** Live keys and business verification.
